Space charge calculations

May 02 2016

Carlos Perez Sourav Tarafdar

Outlook:

- R-Distortions ALICE/PHENIX
- Charge density from FP

Methodology for distortions

- Initial Charge Density [toy model (ala ALICE)]
- Er and Ez from Laplace solution to ICD in cage at V=0
- DeltaR from Langevin formalism using Ez = 400V/cm

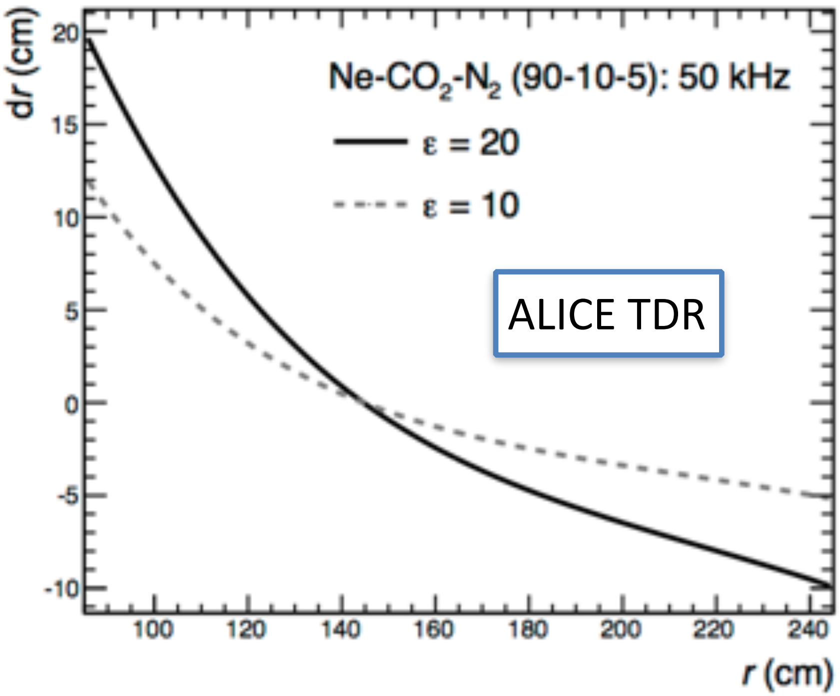
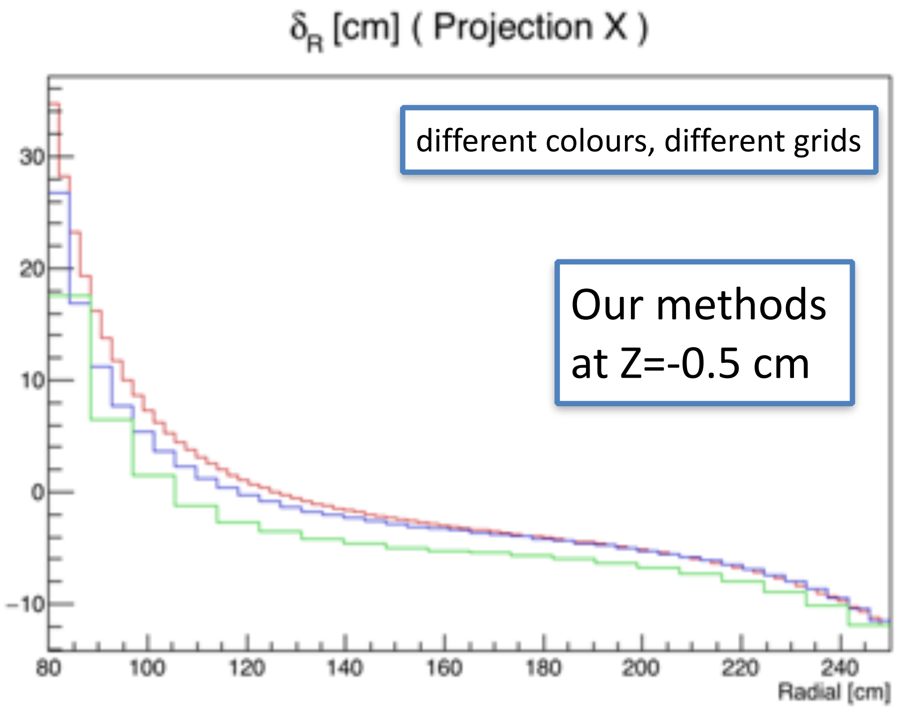
Dr detailed shape comparison





Quantitatively close, but not quite the right shape

Source of incongruence:

- We do Laplace expansion up to 15th order (ALICE claims 30th)
- We use Ez = E0 + dEz (ALICE does not say)
- We probe Dr at z=-0.5 cm (ALICE gets it at z=0.5)
- We use 1/r^2 in ICD (ALICE claims 1/r^1.5)
- …?

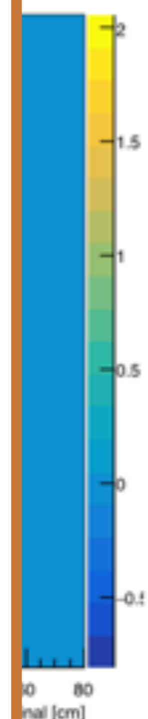
Setting Rin < 30cm while instrumenting only starting from 30cm presents an advantage when it comes to SC distortions



More on Initial Charge Density

- Initial Charge Density was modelled so far using phenomenological expression from ALICE/STAR

- Many control variables like “gas factor”, “multiplicity”, “ion-feedback” are used heuristically.

- To gain full control on the gas response and realistic track density, it is desirable to model this from First Principles.

Very preliminary

Algorithm Flow chart

ChargeMap(X)

1. Contains list of ions/electrons in TPC

RecordTime

Event

1. Generate particles (X,P) Pythia / HIjing
2. Particles -> helix traces
3. traces -> electron - ion
4. pushes new pairs into "ChargeMap"

Transport

1. Evolves ChargeMap in lapse between events

Parameters used

```
//================
// Gas parameters
float gs_nt = 47.80; // [cm^-1]
float gs_ion_mobility = 4; // [cm^2/(V.s)]

//================
// TPC running conditions
float tpc_magnetic_field = 1.5; // [Tesla]
float tpc_electric_field = 400; // [V/cm]
float tpc_drift_velocity_e = 8; // [cm/us]
float tpc_drift_velocity_i = tpc_electric_field*gs_ion_mobility*1e-3; // [cm/ms]
float tpc_readout_rate = 50; // [kHz]
```

TPC dimensions: Rad = [30,80] cm | Length = 2 x 80cm

Space charge density for STAR

$$\rho\,(r\_,\ z\_) := A\left(\frac{1 - b\,z + c\,\epsilon}{f_d\,r^d}\right)$$

ALICE has this factor named "empirical factor" quoted as 76628

Derivation for ALICE from STAR

3.2. Scaling STAR observations to ALICE expectations

The normalized distribution of charge density used in the STAR TPC to correct for the space-charge effect is:

$$\rho(r,z) = \frac{(L-z)}{L}\,\frac{(r_O^2 - r_I^2)}{\log(r_O/r_I)}\,\frac{0.01}{1.5\cdot 10^6}\,\frac{IR}{r^2} \qquad (6)$$

where r_O=200 cm and r_I=47.9 cm are the outer and inner radii (STAR TPC dimensions). The empirical factor which corresponds roughly to an interaction rate (IR) of 15 kHz for Au–Au collisions at a center of mass energy of 200 GeV is then:

$$F_E = \frac{(r_O^2 - r_I^2)}{\log(r_O/r_I)}\,\frac{0.01}{1.5\cdot 10^6} = 1.76\cdot 10^{-2}$$

- **So for STAR the empirical factor should look like :**
  $F_{E,S}$ = (Min bias multiplicity in STAR) / F_E , where F_e 1.76 e-02
  = 340./ 1.76e-02 = 19318.2

- Inner radius = 50 cm, Outer radius = 200 cm, Longitudinal length = 210 cm, phi = 2*pi
- A = [G] X [m] X [r]X [e_0] /19318. [in C/m]
  - e_0 (=8.85e-12) : vacuum permittivity
  - G = 1
  - M : Event multiplicity = 170
  - R : Total interaction rate = 15 kHz
- b : 1/driftlength
- c*e : 0 for all the plots in next few slides
- Radial dependence (d) = 2 & f_d =1

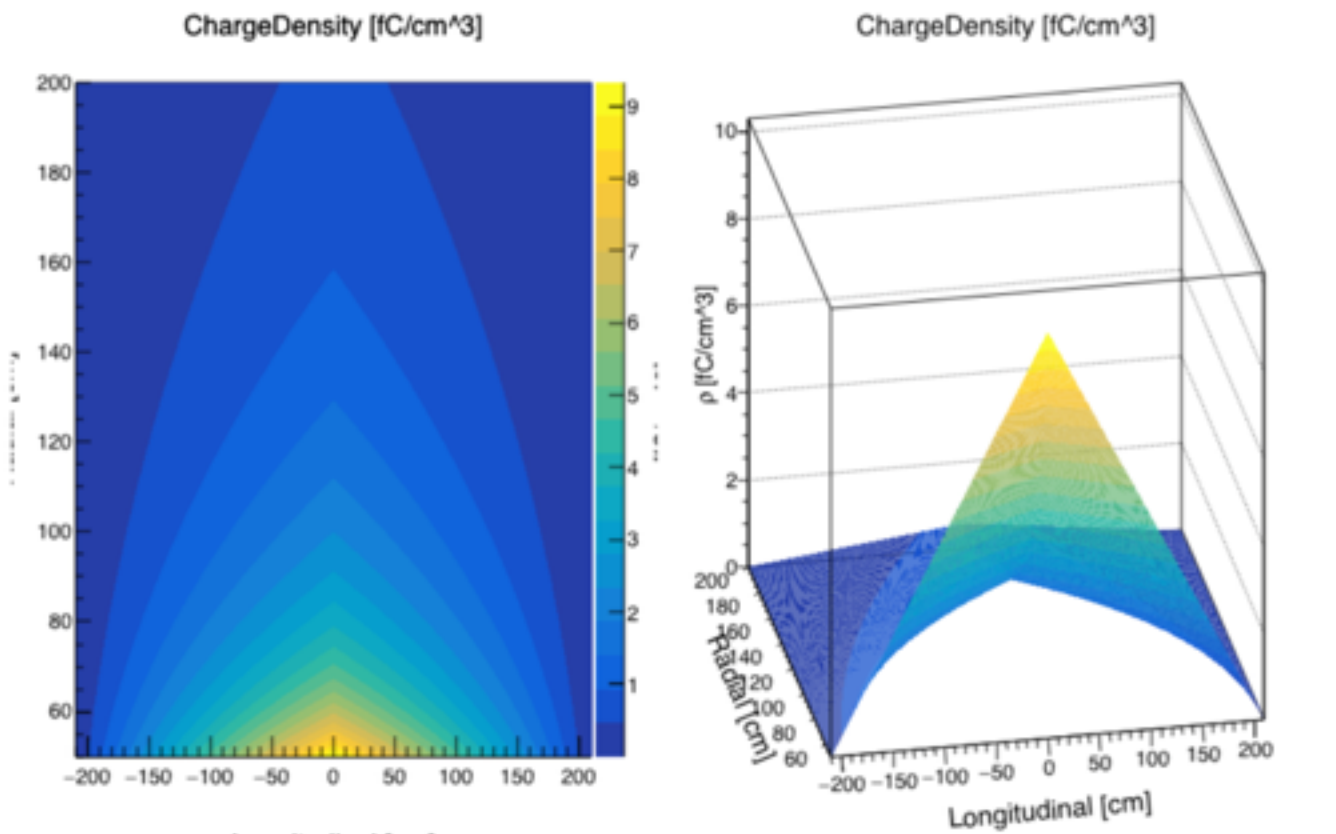
Using formula (6), we can calculate an empirical factor for the ALICE TPC where we include a scaling factor for the min.bias multiplicities (with $M_{mb,S}$ = 127 for the top 80 % within STAR) and the design scaling factor F_D from Tab. 4:

$$F_{E,A} = (F_E \cdot F_D/M_{mb,S})^{-1} = 76628\,.$$

The complete empirical formula can be written as:

Few cases of STAR charge density by changing the gas factor and keeping c*eps = 0

Gas Factor [G] = 1.0



$$\rho(50\mathrm{cm}, 0\mathrm{cm}) = 1.9 \times 10^{-14} \frac{\mathrm{coul}}{\mathrm{cm}^3}$$

Setting gas factor [G] between 0.2 and 0.5 gives almost same estimate of space charge as done by STAR for STAR TPC

Space charge density in the TPC volume

Toy model:

$$\rho(r\_, z\_) := A \left(\frac{1 - b\,z + c\,\epsilon}{f_d\, r^d} \right)$$

1. Proportionality to the primary ionisation (i.e. local track density in a collision) r^-2 dependence and Z drift velocity
2. Back flow dependence as CTE in Z direction

Space charge density in the TPC volume

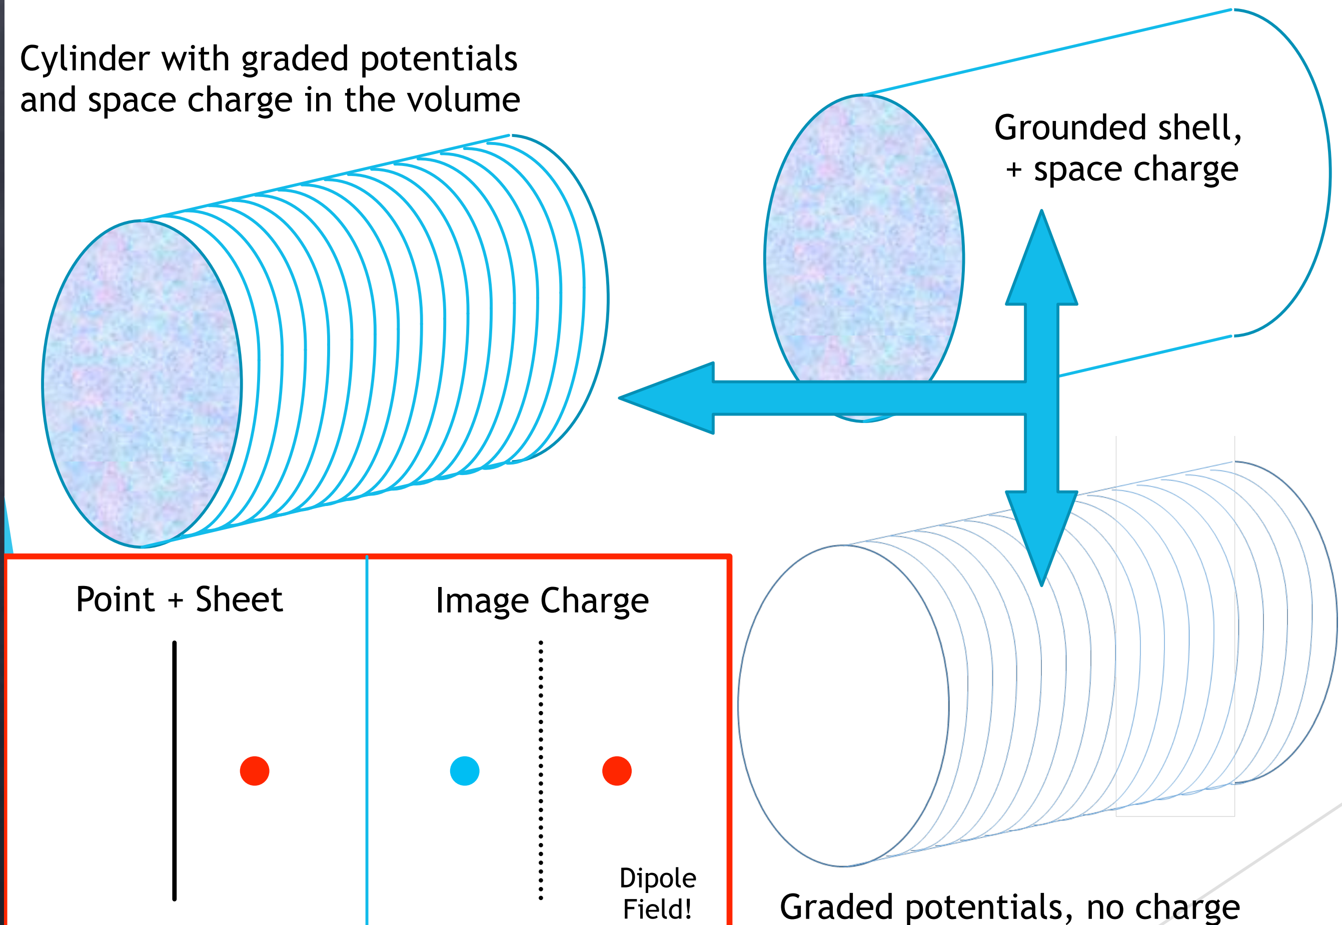
$$\rho(r\_, z\_) := A\left(\frac{1 - b\,z + c\,\epsilon}{f_d\, r^d}\right)$$

- A = [G] x [M] x [R] x [e_0] / 76628   [in C/m]
    - e_0 (=8.85e-12): vacuum permittivity [in As/(Vm)]
    - G (=1): gas factor (prim ioniz. / drift velocity)
    - M (=950): nominal event multiplicity
    - R (=5e4): total interaction rate [in Hz]
- b (=1/2.5): 1/DriftLength [in 1/m]
- c*e (=2/3*20)
- d (=2 for STAR f_d=1; =1.5 for ALCE)

All gas parameters are embedded in G/76628

Tom

Factorization of the Space Charge Problem



- Graded field cage field determined by ANSYS or COLSOL finite element calculations.
- Grounded shell solved using Greene's theorem

$$\Delta G(r, r_{ch}) = \delta(r - r_{ch})$$

$$E_{ch}(r, r_{ch}) = \nabla G(r, r_{ch})$$

$$E = \int \rho(r_{ch}) E_{ch}(r, r_{ch}) dV_{ch}$$

Carlos Tom

Tom

Basic Approach to Solving the Cylinder

- The problem at hand is this: $\Delta G(\vec{x};\vec{x}') = -\delta(\vec{x}-\vec{x}')$, (5.13)

$$\left[\frac{\partial^2}{\partial r^2}+\frac{1}{r}\frac{\partial}{\partial r}+\frac{1}{r^2}\frac{\partial^2}{\partial\phi^2}+\frac{\partial^2}{\partial z^2}\right]G(r,\phi,z;r',\phi',z') = -\frac{\delta(r-r')}{r'}\,\delta(\phi-\phi')\,\delta(z-z'), \quad (5.14)$$

- Our solution begins with solving the homogeneous equation to provide a basis set of functions for the full solution:

$$\Delta\Phi = 0, \qquad \left(\frac{\partial^2}{\partial r^2}+\frac{1}{r}\frac{\partial}{\partial r}+\frac{1}{r^2}\frac{\partial^2}{\partial\phi^2}+\frac{\partial^2}{\partial z^2}\right)\Phi(r,\phi,z) = 0, \qquad \Phi(r,\phi,z) = R(r)\Phi(\phi)Z(z).$$

Periodicity set m=0,1,2,3,…

$$\Phi_m(\phi) = C_m\,e^{im\phi} = A_m\cos(m\phi) + B_m\sin(m\phi) \qquad \text{with } m\in\mathbb{Z}.$$

$$\frac{R_{rr}}{R}+\frac{1}{r}\frac{R_r}{R}-\frac{m^2}{r^2} = -\frac{Z_{zz}}{Z} = \begin{cases} -\beta^2, & \text{case I;} \\ \beta^2, & \text{case II.} \end{cases}$$

Solution without boundary conditions applied:

$$Z_m(z) = C_m\cosh(\beta z) + D_m\sinh(\beta z),$$
$$R_m(r) = E_m J_m(\beta r) + F_m Y_m(\beta r).$$

Constants formulated to explicitly vanish at r=a

$$R_{mn}(r) = Y_m(\beta_{mn}a)J_m(\beta_{mn}r) - J_m(\beta_{mn}a)Y_m(\beta_{mn}r).$$

Vanishing at r=b forces β to become discreet.

Tom

Finishing the solution

- Once the solutions to the homogeneous equation are known, we express the Dirac delta function in this basis:

$$\begin{aligned} \delta(\phi-\phi') &= \frac{1}{2\pi}\sum_{m=-\infty}^{\infty} e^{im(\phi-\phi')} = \frac{1}{2\pi}\sum_{m=0}^{\infty}(2-\delta_{m0})\cos[m(\phi-\phi')], \\ \frac{\delta(r-r')}{r} &= \sum_{n=1}^{\infty}\frac{R_{mn}(r)R_{mn}(r')}{\bar{N}_{mn}^2} \quad \text{with} \quad \bar{N}_{nm}^2 = \int_a^b R_{mn}^2(r)\, r dr, \\ m &= 0, 1, 2, \dots \,. \end{aligned}$$

- After which the solution is readily obtained:

$$G(r,\phi,z;r',\phi',z') = \frac{1}{2\pi}\sum_{m=0}^{\infty}\sum_{n=1}^{\infty}(2-\delta_{m0})\cos[m(\phi-\phi')]\frac{R_{mn}(r)R_{mn}(r')}{\bar{N}_{mn}^2}\frac{\sinh(\beta_{mn}z_<)\sinh(\beta_{mn}(L-z_>))}{\beta_{mn}\sinh(\beta_{mn}L)}.$$

- Although the solution is correct, it is not assured to be readily convergent.
- Rossegger used three independent basis sets to obtain stable, differentiable, convergent solutions for the r, ϕ, and z components of the field:

$$\frac{\partial}{\partial z}G(r,\phi,z,r',\phi',z') = \frac{1}{2\pi}\sum_{m=0}^{\infty}\sum_{n=1}^{\infty}(2-\delta_{m0})\cos[m(\phi-\phi')]\frac{R_{mn}(r)R_{mn}(r')}{N_{mn}^2}\frac{\partial}{\partial z}\left(\frac{\sinh(\beta_{mn}z_<)\sinh(\beta_{mn}(L-z_>))}{\beta_{mn}\sinh(\beta_{mn}L)}\right), \tag{5.64}$$

$$\text{with} \quad \frac{\partial}{\partial z}\left(\sinh(\beta_{mn}z_<)\sinh(\beta_{mn}(L-z_>))\right) = \begin{cases} \beta_{mn}\cosh(\beta_{mn}z)\sinh(\beta_{mn}(L-z')), & \text{for } 0 \le z < z' \le L, \\ -\beta_{mn}\cosh(\beta_{mn}(L-z))\sinh(\beta_{mn}z'), & \text{for } 0 \le z' < z \le L. \end{cases}$$

$$\frac{\partial}{\partial r}G(r,\phi,z,r',\phi',z') = \frac{1}{\pi L}\sum_{m=0}^{\infty}\sum_{n=1}^{\infty}(2-\delta_{m0})\cos[m(\phi-\phi')]\sin(\beta_n z)\sin(\beta_n z')\frac{\partial}{\partial r}\left(\frac{R_{mn\,1}(r_<)R_{mn\,2}(r_>)}{I_m(\beta_n a)K_m(\beta_n b)-I_m(\beta_n b)K_m(\beta_n a)}\right), \tag{5.65}$$

$$\text{with} \quad \frac{\partial}{\partial r}\left(R_{mn\,1}(r_<)R_{mn\,2}(r_>)\right) = \begin{cases} R'_{mn}(a,r)R_{mn\,2}(r'), & \text{for } a \le r < r' \le b, \\ R_{mn\,1}(r')R'_{mn}(b,r), & \text{for } a \le r' < r \le b, \end{cases}$$

wherein $R'_{mn}(s,t)$ is

$$R'_{mn}(s,t) = \frac{\beta_n}{2}\left(K_m(\beta_n s)(I_{m-1}(\beta_n t)+I_{m+1}(\beta_n t)) + I_m(\beta_n s)(K_{m-1}(\beta_n t)+K_{m+1}(\beta_n t))\right).$$

$$\frac{\partial}{\partial \phi}G(r,\phi,z,r',\phi',z') = \frac{1}{L}\sum_{k=1}^{\infty}\sum_{n=1}^{\infty}\sin(\beta_n z)\sin(\beta_n z')\frac{R_{nk}(r)R_{nk}(r')}{N_{nk}^2}\frac{\partial}{\partial \phi}\left(\frac{\cosh[\mu_{nk}(\pi-|\phi-\phi'|)]}{\mu_{nk}\sinh(\pi\mu_{nk})}\right) \tag{5.66}$$

$$\text{with} \quad \frac{\partial}{\partial \phi}\left(\cosh[\mu_{nk}(\pi-|\phi-\phi'|)]\right) = \begin{cases} -\mu_{nk}\sinh[\mu_{nk}(\pi-(\phi-\phi')), & \text{for } 0 \le \phi' < \phi \le 2\pi \\ \mu_{nk}\sinh[\mu_{nk}(\pi-(\phi'-\phi)), & \text{for } 0 \le \phi < \phi' \le 2\pi \end{cases}$$

Langevin Eq:

charge of the drifting particle

Friction (K>0)

$$m\frac{d\vec{u}}{dt} = qe\vec{E} + qe\left[\vec{u}\times\vec{B}\right] - K\vec{u}$$

drift velocity

EB force

Solution:

$t \gg m/K$ Adiabatic approx. $\frac{d\vec{u}}{dt} = 0$ Steady state

$$\vec{u} = \frac{\mu\left|\vec{E}\right|}{1+\omega^2\tau^2}\left[\hat{E} + \omega\tau\left(\hat{E}\times\hat{B}\right) + \omega^2\tau^2\left(\hat{E}\cdot\hat{B}\right)\hat{B}\right]$$

scalar mobility of the electric field

$\mu = \frac{qe}{K}$

mean interaction time between drifting electrons and atoms from the gas

cyclotron frequency for electron

$\omega\tau = q\mu B$

Drift velocity in cartesian coordinates

$$u_x = \frac{\mu \left|\vec{E}\right|}{1+\omega^2\tau^2}\left[\hat{E}_x + \omega\tau\left(\hat{E}_y\hat{B}_z - \hat{E}_z\hat{B}_y\right) + \omega^2\tau^2\left(\hat{E}\cdot\hat{B}\right)\hat{B}_x\right]$$

$$u_y = \frac{\mu \left|\vec{E}\right|}{1+\omega^2\tau^2}\left[\hat{E}_y + \omega\tau\left(\hat{E}_z\hat{B}_x - \hat{E}_x\hat{B}_z\right) + \omega^2\tau^2\left(\hat{E}\cdot\hat{B}\right)\hat{B}_y\right]$$

$$u_z = \frac{\mu \left|\vec{E}\right|}{1+\omega^2\tau^2}\left[\hat{E}_z + \omega\tau\left(\hat{E}_x\hat{B}_y - \hat{E}_y\hat{B}_x\right) + \omega^2\tau^2\left(\hat{E}\cdot\hat{B}\right)\hat{B}_z\right]$$

We can compute the path integral of the drifting electron

$$\delta_x = \int u_x \, dt = \int \frac{u_x}{u_z}\frac{dz}{dt}\, dt = \int \frac{u_x}{u_z}\, dz$$

$$\delta_y = \int \frac{u_y}{u_z}\, dz \qquad \delta_z = \int \frac{u_z}{u_0}\, dz$$

TPC case: Ez >> Ex,Ey Bz >> Bx,By

$$u_x = \frac{\mu \left|\vec{E}\right|}{1+\omega^2\tau^2}\left[\hat{E}_x + \omega\tau\left(\hat{E}_y\hat{B}_z - \hat{E}_z\hat{B}_y\right) + \omega^2\tau^2\left(\hat{E}\cdot\hat{B}\right)\hat{B}_x\right]$$

$$u_y = \frac{\mu \left|\vec{E}\right|}{1+\omega^2\tau^2}\left[\hat{E}_y + \omega\tau\left(\hat{E}_z\hat{B}_x - \hat{E}_x\hat{B}_z\right) + \omega^2\tau^2\left(\hat{E}\cdot\hat{B}\right)\hat{B}_y\right]$$

$$u_z = \frac{\mu \left|\vec{E}\right|}{1+\omega^2\tau^2}\left[\hat{E}_z + \omega\tau\left(\hat{E}_x\hat{B}_y - \hat{E}_y\hat{B}_x\right) + \omega^2\tau^2\left(\hat{E}\cdot\hat{B}\right)\hat{B}_z\right]$$

Second order expansion:

$$\hat{E}_x \approx \frac{\hat{E}_x}{E_z} \qquad \hat{E}_z \approx 1 - \frac{1}{2}\hat{E}_x^2 - \frac{1}{2}\hat{E}_y^2$$

$$\frac{u_x}{u_z} = \frac{1}{1+\omega^2\tau^2}\frac{E_x}{E_z} + \frac{\omega\tau}{1+\omega^2\tau^2}\frac{E_y}{E_z} - \frac{\omega\tau}{1+\omega^2\tau^2}\frac{B_y}{B_z} + \frac{\omega^2\tau^2}{1+\omega^2\tau^2}\frac{B_x}{B_z}$$

$$\frac{u_y}{u_z} = \frac{1}{1+\omega^2\tau^2}\frac{E_y}{E_z} - \frac{\omega\tau}{1+\omega^2\tau^2}\frac{E_x}{E_z} + \frac{\omega\tau}{1+\omega^2\tau^2}\frac{B_x}{B_z} + \frac{\omega^2\tau^2}{1+\omega^2\tau^2}\frac{B_y}{B_z}$$
